NOTATION

C	Linear damping factor in $C\dot{X}$ in Equation [1]
F_c	Fourier cosine transform value at ω
F_s	Fourier sine transform value at ω
f	Frequency in cycles per second
h	An increment of time
M	Mass
p	Damped natural frequency of linear system
S_n	First forward difference at n
S_n^2	Second forward difference at n
t	Time in seconds
X	Relative displacement ($Y-Z$) or response displacement
ωX	Pseudo-response velocity
$\omega^2 X$	Pseudo-response acceleration
Y	Absolute displacement of the linear oscillator from its equilibrium position
Z	Displacement of foundation from its equilibrium position
α	Ratio of damping to critical linear damping or damping coefficient
ω	Undamped natural frequency of linear system in radians per second

ABSTRACT

This paper describes a computer program and a mathematical model (developed by G.J. O'Hara of the Naval Research Laboratory) for computing shock and residual shock spectra of linear elastic structures responding to transient forces and foundation motions. A wide range of output options, from tabulated results to a four-coordinate log-log grid, is possible. Included in the mathematical analysis of the shock spectra is a refinement in determining maximum responses, suggested by O'Hara, resulting in a more accurate shock spectrum. The program is written in FORTRAN IV for the IBM 7090 and includes plotting subroutines for the General Dynamics S-C 4020 printer-plotter. The program is also coded without the S-C 4020 subroutines.

ADMINISTRATIVE INFORMATION

The Naval Ship Systems Command (formerly Bureau of Ships) authorized and sponsored this work by Bureau of Ships letter 10460 Serial 732-7 of 5 Feb 1965.

INTRODUCTION

The Naval Ship Systems Command requested the Applied Mathematics Laboratory of the David Taylor Model Basin to develop a series of programs widely applicable in scope for static and dynamic structural analysis. The code presented is a computerization of O'Hara's¹ techniques for shock analysis. The program generates various forms of shock and residual shock spectra for the response of a structure to a transient force or foundation motion when the mathematical model used for the structure is a single-degree-of-freedom linear oscillator. The spectra are used to find the displacement of a structure caused by an arbitrarily prescribed transient motion to its base, such as response of buried structures to an underground blast or response of structures within a vehicle during ballistic impact. In addition, if the input shock function to the program is an acceleration, the residual shock spectrum that is generated is also the Fourier spectrum of the system.

The program is written in FORTRAN IV and is executed on an IBM 7090 using the IBSYS, Version 13, Monitor System in conjunction with a Stromberg-Carlson 4020 printer-plotter. In the appendix, coding is furnished without reference to the plotter, thus making the program more adaptable to other FORTRAN IV compilers.

¹References are listed on page 117.

MATHEMATICAL ANALYSIS

The mathematical model for shock analysis here is the simple linear oscillator. The general differential equation for the motion in Figure 1 is

$$M\ddot{Y} + C\dot{X} + KX = F(t) \quad [1]$$

where X is the relative displacement $Y-Z$, $C\dot{X}$ is the damping term, and KX is the restoring force, based on Hooke's law. Now using standard notation, where C is less than the critical

Figure 1 – Linear Oscillator

damping factor, we let

$$\omega^2 = \frac{K}{M}, \quad \alpha = \frac{C}{2M\omega}, \quad \text{and } p = \omega \sqrt{1 - \alpha^2}$$

Substituting this into Equation [1], we obtain the following equation

$$\ddot{Y} + 2\alpha\omega\dot{Y} + \omega^2 Y = 2\alpha\omega\dot{Z} + \omega^2 Z + \frac{F(t)}{M} \quad [2]$$

There are two types of motion that are of interest that result from, either no applied force, i.e., $F(t) = 0$ and foundation motion, or no foundation motion, i.e., $Z = 0$ and an applied force. The remainder of this section will mainly describe the first case, where $F(t) = 0$. The latter case, where $Z = 0$, will be dealt with only at the end. The word shock will be used interchangeably with the term input function, namely, \dot{Z} , \ddot{Z} , or $F(t)$. When $F(t) = 0$, Equation [2] becomes

$$\ddot{Y} + 2\alpha \omega \dot{Y} + \omega^2 Y = 2\alpha \omega \dot{Z} + \omega^2 Z,$$

or since $Y - Z = X$,

$$\ddot{X} + 2\alpha \omega \dot{X} + \omega^2 X = -\ddot{Z} \quad [3]$$

Using Laplace transforms, we find the solution to Equation [3] to be

$$X(t) = X(0) e^{-\alpha \omega t} \left(\cos pt + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin pt \right) + \dot{X}(0) \frac{e^{-\alpha \omega t} \sin pt}{p} \\ - \frac{1}{p} \int_0^t \ddot{Z}(T) e^{-\alpha \omega [t-T]} \sin p(t-T) dT \quad [4]$$

whereas the derivative of Equation [4] is

$$\dot{X}(t) = e^{-\alpha \omega t} X(0) \left[-\alpha \omega \left(\cos pt + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin pt \right) - p \sin pt \right. \\ \left. + \frac{p \alpha \cos pt}{\sqrt{1-\alpha^2}} \right] + \frac{\dot{X}(0) e^{-\alpha \omega t}}{p} (-\alpha \omega \sin pt + p \cos pt) \\ + \frac{1}{p} \int_0^t \ddot{Z}(T) e^{-\alpha \omega [t-T]} [\alpha \omega \sin p(t-T) - p \cos p(t-T)] dT \quad [5]$$

Equation [4] gives the relative response displacement of the mass to the shock $\ddot{Z}(t)$ in terms of given initial displacements and velocities. The solution of the differential equation is not useful yet, for the integral must be evaluated. Now, if the solution were known at $t = t_1$, the values of relative displacement (X) and relative velocity (\dot{X}) could be considered initial values at t_1 for the solution at $t_1 + \Delta t$, using Equations [4] and [5] again. A convenient procedure followed in the numerical solution of the differential equation consists of subdividing the time record into equal increments, each of duration $\Delta t = h$ seconds, so the method of evaluating $X(t)$ at each point will require the same equations. Of course, the values of X and \dot{X} at the beginning of the time record must be given to use this procedure for solving the differential equation, and also the input function \ddot{Z} must be digitized into equal increments. A parabolic approximation for $\ddot{Z}(t)$ between 0 and h is substituted in

Equations [4] and [5], then the integrals are evaluated. In addition, the approximation for $\ddot{Z}(t)$ at any point in the time record will go through its preceding point as well as its successive point. If the time is subdivided into enough intervals, h , no sudden peaks of \ddot{Z} should be missed by the approximating parabola for \ddot{Z} .

A useful change in notation follows: $X(ih) = X_i$, $\ddot{Z}(ih) = \ddot{Z}_i$, where \ddot{Z}_i is the $(i + 1)$ th point in the time record, $i = 0, 1, 2, 3, \dots, k$, and $k + 1$ is the number of points in the time record.

The parabola passing through \ddot{Z}_{n-1} , \ddot{Z}_n , \ddot{Z}_{n+1} yields the equation

$$\ddot{Z}(t) = \frac{(\ddot{Z}_{n+1} - 2\ddot{Z}_n + \ddot{Z}_{n-1})}{2h^2} t^2 + \frac{(\ddot{Z}_{n+1} - \ddot{Z}_{n-1})}{2h} t + \ddot{Z}_n \quad [6]$$

for $(n - 1)h \leq t \leq (n + 1)h$. A few notational changes will simplify Equation [6]: let

$$S_n = \ddot{Z}_{n+1} - \ddot{Z}_n \text{ and } S_{n-1}^2 = S_n - S_{n-1} = \ddot{Z}_{n+1} - 2\ddot{Z}_n + \ddot{Z}_{n-1}$$

so Equation [6] becomes

$$\ddot{Z}(t) = \ddot{Z}_n + \frac{S_n t}{h} + \frac{S_{n-1}^2}{2} \left(\frac{t^2}{h^2} - \frac{t}{h} \right) \quad [7]$$

Now, using Equation [7] in the integral in place of $\ddot{Z}(t)$ in Equation [4], integrating by parts from 0 to h , and finally substituting h for t in the other terms of Equation [4] lead to the final equation for the response at each point in the time record:

$$\begin{aligned} \omega X_{n+1} &= \omega X_n e^{-\alpha\omega h} \left(\cos ph + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \\ &+ \dot{X}_n \frac{e^{-\alpha\omega h} \sin ph}{\sqrt{1-\alpha^2}} - \frac{\ddot{Z}_n}{\omega} \left[1 - e^{-\alpha\omega h} \left(\cos ph + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \right] \\ &- \frac{S_n}{\omega} \left[1 - \frac{2\alpha}{\omega h} (1 - e^{-\alpha\omega h} \cos ph) - \frac{(1 - 2\alpha^2) e^{-\alpha\omega h} \sin ph}{ph} \right] \end{aligned}$$

$$\begin{aligned}
& - \frac{S_{n-1}^2}{2\omega} \left\{ -\frac{4\alpha}{\omega h} - \left[2 \frac{(1-4\alpha^2)}{\omega^2 h^2} - \frac{2\alpha}{\omega h} \right] (1 - e^{-\alpha\omega h} \cos ph) \right. \\
& \left. + \left[\frac{1-2\alpha^2}{\omega h} + 2\alpha \frac{(3-4\alpha^2)}{\omega^2 h^2} \right] \frac{e^{-\alpha\omega h} \sin ph}{\sqrt{1-\alpha^2}} \right\} \quad [8]
\end{aligned}$$

and using the same method in developing Equation [8] transforms Equation [5] into

$$\begin{aligned}
\dot{X}_{n+1} &= -\omega X_n \frac{e^{-\alpha\omega h} \sin ph}{\sqrt{1-\alpha^2}} + \dot{X}_n e^{-\alpha\omega h} \left(\cos ph - \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \\
& - \frac{\ddot{Z}_n}{\omega} \frac{e^{-\alpha\omega h} \sin ph}{\sqrt{1-\alpha^2}} - \frac{S_n}{\omega} \left[\frac{1}{\omega h} - \frac{e^{-\alpha\omega h}}{\omega h} \left(\cos ph + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \right] \\
& - \frac{S_{n-1}^2}{\omega} \left\{ \frac{2}{\omega h} - \left(\frac{1}{\omega h} + \frac{4\alpha}{\omega^2 h^2} \right) (1 - e^{-\alpha\omega h} \cos ph) \right. \\
& \left. - \left[\frac{2(1-2\alpha^2)}{\omega^2 h^2} - \frac{\alpha}{\omega h} \right] \frac{e^{-\alpha\omega h} \sin ph}{\sqrt{1-\alpha^2}} \right\} \quad [9]
\end{aligned}$$

The response X is scaled by ω in Equation [8], because ωX is a meaningful quantity, as will be explained later. Consider a time record of \ddot{Z} versus time; the initial values must be given before Equations [8] and [9] can be used, i.e., $X(t_0)$ and $\dot{X}(t_0)$ must be known. Also, S_0 for $t = t_0 + h$ is $Z(t_0 + h) - Z(t_0)$, and S_{n-1}^2 where $n = 1$, becomes $\ddot{Z}(2h + t_0) - 2\ddot{Z}(h + t_0) + \ddot{Z}(t_0)$.

Of more interest to the engineer is not the response (X) at each point in the time record for a particular frequency, but the maximum or minimum response for each frequency over a given range of frequencies. Essentially, for the given range of frequencies one obtains the maximum response as a function of frequency. The maximum and minimum response ($X\omega$) for each frequency is selected from the values of $X\omega$ for the complete time record. The refinement of the maximum and minimum (a more accurate estimate) is achieved by first noting that the product of \dot{X}_{\max} , the derivative of the chosen X_{\max} , and $\dot{X}_{\max-h}$, the derivative of $X_{\max-h}$, is positive if X_{\max} reaches its true maximum between X_{\max} and $X_{\max+h}$ and is negative if the true maximum occurs between X_{\max} and $X_{\max-h}$; this is illustrated by the two possibilities that follow

Here, let $X_{\max} = X(nh)$, $X_{\max+h} = X((n+1)h)$, and $X_{\max-h} = X((n-1)h)$

Possibility 1

$\dot{X}((n-1)h) \cdot \dot{X}(nh)$ is negative, so true maximum occurs between $X_{\max-h}$ and X_{\max}

Possibility 2

$\dot{X}((n-1)h) \cdot \dot{X}(nh)$ is positive, so true maximum occurs between X_{\max} and $X_{\max+h}$

Equation [8] is used after it is determined whether the true maximum or minimum is within the range of $X_{\max-h}$, X_{\max} or $X_{\max+h}$. $X\omega$ is then evaluated at intervals of $0.2h$, and the largest $X\omega$ in the subinterval is taken as the more accurate (refined) maximum. The method for computing the refined minimum value of $X\omega$ is the same. The calculation for $X\omega$ at a given frequency is stopped at a time which corresponds to the start of residual time (when the shock or impulse ceases), which is usually determined by the experimenter from examining the plot of the input function $\ddot{Z}(t)$.

Some definitions of variables appearing in the mathematical analysis are in order at this point.

X = response displacement
 $X\omega$ = pseudo-response velocity
 $X\omega^2$ = pseudo-response acceleration
 \dot{X} = true response velocity

$\sqrt{(X\omega)^2 + \dot{X}^2}$ = residual response (in velocity units) at the end of the time record, i.e., at the beginning of residual time. The residual response is computed only when there is no damping.

The shock spectrum is usually the plot of maximum $|X\omega|$ versus f , where f is $2\pi\omega$, and the residual shock spectrum is a plot of $\sqrt{(X\omega)^2 + \dot{X}^2}$ versus f .

When $\omega = 0$, equations for $X\omega$ and \dot{X} as already presented become meaningless, even though X at $\omega = 0$ has physical meaning. New equations are derived from [8] and [9] by using L'Hospital's rule. In Equations [8] and [9] ω is set equal to zero, and when an indeterminant form is encountered, L'Hospital's rule is used; therefore, yielding

$$X_{n+1} = X_n + \dot{X}_n h - \frac{\ddot{Z}_n h^2}{2} - \frac{S_n h^2}{6} + \frac{h^2}{24} S_{n-1}^2 \quad [10]$$

$$\dot{X}_{n+1} = -\ddot{Z}_n h - S_n \frac{h}{2} + \frac{S_{n-1}^2 h}{12} \quad [11]$$

It is observed that damping does not play any role in the foregoing equations.

An added feature of the residual shock spectrum solution is that, if the input shock function is an acceleration (\ddot{Z}), then the Fourier spectrum is identical to the residual shock spectrum. The Fourier spectrum magnitude at ω is defined as $(F_c^2 + F_s^2)^{1/2}$, where it is found that

$$F_c = -X\omega \sin \omega t - \dot{X} \cos \omega t$$

and

$$F_s = X \omega \cos \omega t - \dot{X} \sin \omega t$$

By substitution, $(F_c^2 + F_s^2)^{1/2}$ becomes $[(X \omega)^2 + \dot{X}^2]^{1/2}$, which is the residual shock spectrum magnitude for ω . The Fourier spectrum is not necessarily equivalent to the residual shock spectrum when the input shock spectrum is \ddot{Z} . A thorough discussion of Fourier spectra can be found in Reference 1. The author is presently finishing a program dealing with Fourier spectra such as computing the Fourier spectrum magnitude, the phase angle, the Fourier cosine transform, and the Fourier sine transform, so a detailed description of Fourier spectra will be contained in a subsequent report from the Applied Mathematics Laboratory at the David Taylor Model Basin.

Until now the input shock function was assumed to be \ddot{Z} (foundation acceleration), so the necessary equations for an input function which is the foundation velocity (\dot{Z}) will now be considered.

$$S_n = \dot{Z}_{n+1} - \dot{Z}_n$$

$$S_{n-1}^2 = S_n - S_{n-1} = \dot{Z}_{n+1} - 2\dot{Z}_n + \dot{Z}_{n-1}$$

$$\dot{Z}(t) = \dot{Z}_n + S_n \frac{t}{h} + \frac{S_{n-1}^2}{2} \left(\frac{t^2}{h^2} - \frac{t}{h} \right) \quad [12]$$

where \ddot{Z} is replaced by \dot{Z} .

$$X_{n+1} \omega = X_n \omega e^{-\alpha \omega h} \left(\cos ph + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) + \frac{\dot{X}_n e^{-\alpha \omega h} \sin ph}{\sqrt{1-\alpha^2}}$$

$$- \frac{S_n}{\omega h} \left[1 - e^{-\alpha \omega h} \left(\cos ph + \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \right]$$

$$- \frac{S_{n-1}^2}{\omega h} \left\{ \frac{1}{2} - \frac{2\alpha}{\omega h} + e^{-\alpha \omega h} \left[\left(\frac{1}{2} + \frac{2\alpha}{\omega h} \right) \cos ph \right. \right.$$

$$\left. \left. - \left(\frac{1-2\alpha^2}{\omega h} - \frac{\alpha}{2} \right) \frac{\sin ph}{\sqrt{1-\alpha^2}} \right] \right\} \quad [13]$$

$$\begin{aligned}
\dot{X}_{n+1} = & - X_n \omega e^{-\alpha \omega h} \frac{\sin ph}{\sqrt{1-\alpha^2}} + \dot{X}_n e^{-\alpha \omega h} \left(\cos ph - \frac{\alpha}{\sqrt{1-\alpha^2}} \sin ph \right) \\
& - \frac{S_n}{\omega h} \frac{e^{-\alpha \omega h} \sin ph}{\sqrt{1-\alpha^2}} - \frac{S_{n-1}^2}{\omega h} \left\{ \frac{1}{\omega h} - e^{-\alpha \omega h} \left[\frac{\cos ph}{\omega h} \right. \right. \\
& \left. \left. + \left(\frac{\alpha}{\omega h} + \frac{1}{2} \right) \frac{\sin ph}{\sqrt{1-\alpha^2}} \right] \right\} \quad [14]
\end{aligned}$$

Equation [13] is obtained from Equation [4] by first integrating by parts, secondly, substituting [12] for $\dot{Z}(t)$ in the new integral, integrating again by parts, and finally substituting h for t in the other terms of Equation [4]. Equation [14] is obtained in a similar manner, using Equation [5] in place of Equation [4]. When ω equals 0,

$$X_{n+1} = X_n + \dot{X}_n h - \frac{S_n h}{2} + \frac{S_n^2 h}{12}$$

and

$$\dot{X}_{n+1} = \dot{X}_n - S_n$$

The rest of the calculations using \dot{Z} are the same as those using \ddot{Z} , except that for the \dot{Z} input, the residual shock spectrum is *not* necessarily identical to the Fourier spectrum.

Finally, to solve a problem where there is no foundation motion but an applied force $F(t)$, we must solve the differential equation.

$$\ddot{X} + 2\alpha \omega \dot{X} + \omega^2 X = \frac{F(t)}{M} \quad [15]$$

Equations [15] and [3] are the same except for their right-hand members, so if the input function is an applied force, viz., $F(t)$, then, since $\ddot{Z}(t) = -\frac{F(t)}{M}$, all of the F_i 's are scaled by $-\frac{1}{M}$ and the input function is treated as if it were $\ddot{Z}(t)$. The output would correctly be the response to $F(t)$.

OUTLINE OF THE PROGRAM

The Roman numeral headings below correspond to the comment cards in the program listing. Tables 1 and 2 and the flow charts in the following section should aid in understanding the ensuing outline. In addition, \emptyset is used to denote an alphabetic O in FORTRAN. The Roman numeral above any figure in the flow chart corresponds to a numeral in the following description.

I. Input

Data is read, such as the forcing function (\dot{Z} or \ddot{Z}), output options, and other constants.

$IP3$ (four-coordinate grid option) is checked for zero, if not zero, $IP1$ and $IP2$ (other plots) are deleted even if they are requested.

II. Write and Plot Input Data

The time T corresponding to each Z is generated by use of the time interval H .

Each Z and corresponding T are written. From statements 110 to 123, Z versus T is plotted.

III. Compute $S(N)$ and $S2ND(N)$ for Each Time T

Each S and $S2ND$ are computed.

A frequency card is read, i.e., $FREQ1$, $FREQ2$, $DELTA F$, then if $FREQ1 = FREQ2$, the blank card was read, indicating the run is finished. If $FREQ1 \neq FREQ2$ the program continues.

The number of frequencies is computed from the card just read, i.e., $N\emptyset FREQ = (FREQ2 - FREQ1)/DELTA F$.

IV. Damped or Undamped; if Undamped, Find Number of Residual Points

The large $D\emptyset$ -loop, which is indexed for each alpha, is executed.

$I\emptyset ALPHA$ is set equal to one if no damping is present ($\alpha = 0$), or set equal to two if there is damping ($\alpha \neq 0$). If no damping is present, the start of residual time is computed, viz., $T(KH)$.

V. Compute Constants

Many mathematical expressions used repeatedly in the program are computed.

$IFREQ$ is set equal to one if the frequency is zero or is set equal to two if the frequency is not zero.

Finally, there is a major branch in the program, depending on whether (1) $Z = \dot{Z}$ and frequency = 0, (2) $Z = \dot{Z}$ and frequency $\neq 0$, (3) $Z = \ddot{Z}$ and frequency = 0, and (4) $Z = \ddot{Z}$ and frequency $\neq 0$. Of the four possibilities just mentioned only possibility 2 will be assumed in the rest of the discussion.

VI. Compute $X\emptyset MEGA$ (N), $XD\emptyset T$ For Velocity Input

More constants and mathematical expressions are evaluated. N $X\emptyset MEGA$'s and $XD\emptyset T$'s are computed in a $D\emptyset$ -loop ending at statement 210.

Then there is transfer to preliminary calculations.

VII. Preliminary Calculations for Minimum and Maximum Response

Maximum and minimum $X\emptyset MEGA$'s are determined; then control is transferred to statement 225.

Statements 225 to 235 contain the refinement calculations for maximum and minimum $X \omega$.

Then from statements 211 to 215 the different output features, which are selected in the input, are executed.

VIII. Either Restart With New Frequency or Restart With New Alpha or Stop

$FREQ$ and $FREQ2$ are compared; if equal, the end of the alpha $D\emptyset$ -loop is reached—statement 800—and either the entire calculation is restarted for a new alpha, or the next frequency card is read.

If $FREQ \neq FREQ2$, then $FREQ$ is incremented by $DELTAF$, and the calculations for $X\emptyset MEGA$, $XD\emptyset T$, etc. are repeated.

TABLE 1

Glossary of Important FORTRAN Variables (Excluding Input Variables)

Variable	Math Symbol and/or Explanation
Dimensioned	
<i>S</i>	S_i , first forward difference where $S_i = Z_{i+1} - Z_i$.
<i>S2ND</i>	S_i^2 , second forward difference where $S_i^2 = Z_{i+1} - 2Z_i + Z_{i-1}$.
<i>XØMEGA</i>	$X\omega$ (and X when $\omega = 0$) response displacement times natural frequency.
<i>X</i>	X , response displacement, used for plotting in <i>IP1</i> , also used for plotting $-X\omega^2$ in <i>IP2</i> .
<i>XDØT</i>	\dot{X} , response velocity.
<i>ØSCIL</i>	F , frequency.
<i>VEL</i>	Maximum absolute value of $X\omega$ for each ω .
<i>RESID</i>	$\sqrt{(X\omega)^2 + \dot{X}^2}$, at the start of residual time.
Undimensioned	
<i>A1</i>	$10^{LØP}$, which is the value of the first <i>A</i> -line drawn on the four-coordinate graph (lower left-hand corner).
<i>D1</i>	$10^{LØP}$, which is the value of the first <i>D</i> -line drawn on the four-coordinate graph (upper left-hand corner).
<i>IER</i>	Number of points out of range when plotting response (<i>X</i>) versus time in <i>IP1</i> .
<i>IERA</i>	Number of points out of range when plotting response velocity (\dot{X}) versus time in <i>IP1</i> .
<i>IERB</i>	Number of points out of range when plotting $-X\omega^2$ versus time in <i>IP2</i> .
<i>IERR</i>	Number of points out of range when plotting the input function <i>Z</i> .

FLOW CHART

NOTE: A_1 is initially set.

FLOW CHART (Continued)

INPUT

The input is read into the computer mostly in the form of FORTRAN NAMELISTS; consequently, the format for the data is not very restrictive. The data are usually on punched cards. If the shock function Z is available on an analog tape, a conversion to digitized tape or to cards must be accomplished before the program can be used. Of course, the NAMELISTS can be replaced by regular format statements, which would be mandatory if the program was converted to FORTRAN II.

See Table 2 for the list of input variables with an explanation of each variable. $ZAZA1$ to $ZAZA4$ are NAMELIST names, each containing one or more variables. (See any IBM FORTRAN IV manual for an explanation of NAMELISTS.) The data cards are arranged as follows: $\$DATA$ card first, then $\$ZAZA1$ data, $\$ZAZA2$ data, $\$ZAZA3$ data, $\$ZAZA4$ data, frequency cards, and finally the system cards: *END OF FILE*, $\$IBSYS$, $\$RESTORE$, and *END OF FILE*.

There is no limit to the number of frequency ranges that can be handled, at one card per range. The last card must be a blank card. The frequency cards are read under format statement 920, viz., 3F20.8, so the decimal point of the first number $FREQ1$ is in column 12, that of the second number $FREQ2$ in column 32, and that of the last number $DELTAf$ in column 52. $FREQ1$ must not equal $FREQ2$; therefore, the first number on the frequency card must be less than the second number. The number of frequencies, $(FREQ2 - FREQ1) \div DELTAf$, must not exceed the storage capacity of the variable $\$SCIL$ when using $IP3$, which is now dimensioned for 1000 words.

If $IP1$ to $IP5$ are set equal to zero, the only output that will result is a plot of the input function, a tabulation of the input function, and a tabulation of S_i and S_i^2 .

If the shock function Z is not on cards, but generated from a formula inserted into the program, then the *READ (5, ZAZA1)* statement must be deleted from the program.

The physical units for most of the quantities used in this program are assumed consistent. The units for the input quantities determine the units for the output values except where specified; for example, the input frequencies should be in cycles per second.

TABLE 2

Input Variables

FORTRAN Name	Comment
<i>Z</i>	Shock function which is dimensioned, either acceleration or velocity.
<i>T</i>	Initial time, really $T(1)$, and is usually zero.
<i>TZERO</i>	Starting time of residual shock, i.e., end of transient.
<i>H</i>	Time increment into which record is subdivided.
<i>XO</i>	Response displacement at time <i>T</i> , usually zero.
<i>N</i>	Number of points, i.e., number of <i>Z</i> 's, must not exceed the dimensioned value for <i>Z</i> in the <i>DIMENSION</i> statement.
<i>XDOT0</i>	Response velocity at time <i>T</i> , usually zero.
<i>ISZ</i>	If <i>ISZ</i> = 0, then $Z = \ddot{Z}$; if <i>ISZ</i> ≠ 0, then $Z = \ddot{Z}$.
<i>IP1</i>	Output Option 1, if <i>IP1</i> = 0, ignored; if <i>IP1</i> ≠ 0, plots of response displacement versus time and response velocity versus time are generated for each frequency and each alpha.
<i>IP2</i>	Output Option 2, if <i>IP2</i> = 0, ignored; if <i>IP2</i> ≠ 0, a plot of negative pseudo-response acceleration versus time is generated for each frequency and each alpha.
<i>IP3</i>	Output Option 3, if <i>IP3</i> = 0, ignored; if <i>IP3</i> ≠ 0, a four-coordinate, log-log graph is produced for each range of frequencies submitted, as well as for each alpha, consisting of response displacement versus frequency, pseudo-response velocity versus frequency, pseudo-response acceleration versus frequency, and, if no damping (alpha = 0), residual response velocity versus frequency. If <i>IP3</i> is used, i.e., <i>IP3</i> ≠ 0, the program will inhibit <i>IP1</i> and <i>IP2</i> .
<i>IP4</i>	Output Option 4 is ignored if <i>IP4</i> = 0; if <i>IP4</i> ≠ 0, tabulation of results is generated (see output for explanation).
<i>IP5</i>	Output Option 5 is ignored, if <i>IP5</i> = 0; if <i>IP5</i> ≠ 0, tabulation of results, more extensive than <i>IP4</i> , is generated (see output for explanation).
<i>ALPHA</i>	Damping coefficient, which is dimensioned.
<i>NALPHA</i>	Number of damping coefficients submitted and must not be greater than the dimension of <i>ALPHA</i> in the <i>DIMENSION</i> statement.
<i>FREQ1</i>	Initial frequency in cycles per second.
<i>FREQ2</i>	Last frequency in cycles per second.
<i>DELTAF</i>	Frequency increment in cycles per second.

OUTPUT

The output from the program is composed of a plot and tabulation of the input shock function, a printout of each S_k and S_k^2 , and the input options. If the printed S_k and S_k^2 are not desired, the statement immediately following statement 200 in the program should be removed.

See Figures 3 and 8 for an example graph of an input function and Sample Problems 1 and 2 for the tabulation of all points plotted for the input functions. Sample Problems 1 and 2 (Appendices A and B) also include sample printouts of S_k and S_k^2 .

Figures 9, 10, 12, and 13 are examples of *IP1*, which is a plot of X versus time and \dot{X} versus time for each frequency and each alpha (damping coefficient).

IP2, illustrated in Figures 11 and 14, is a plot of $-\omega^2 X$ versus time for each frequency and each alpha. The quantity $-\omega^2 X$ is equivalent to the absolute acceleration, Y , when $Z = 0$.

IP3, illustrated in Figures 4-6 and 15-18, is a four-coordinate, log-log grid which is a plot of velocity (ordinate) versus frequency (abscissa), with acceleration lines having negative slope and velocity lines having positive slope superimposed on an originally two-coordinate grid. The value of the A lines increases logarithmically from left to right, and the line labeled A in the lower left corner of the grid corresponds to the value for A printed in the lower right margin. The value of the D lines decreases downward logarithmically, and the line labeled D in the upper left corner of the grid corresponds to the value for D printed in the lower right margin. The shock spectrum is the starred plot ($X \omega$ versus f), and the residual shock spectrum ($\sqrt{(X \omega)^2 + \dot{X}^2}$ versus f), plotted only when $\alpha = 0$, is the plot of zero points. One complete four-coordinate graph is generated for each frequency range and damping coefficient α . Hence, for any given frequency within the plotted range, one could read from the starred curve the pseudo-acceleration A , the pseudo-velocity, and the displacement D ; one could also read from the zero curve, provided there is no damping, the residual shock spectrum magnitude.

IP4 (Short Form) is, for each frequency range and damping coefficient, a tabulation of frequency, the maximum value between the pseudo-velocity ($X \omega$) and the residual response ($\sqrt{(X \omega)^2 + \dot{X}^2}$), and, if no damping is present, the residual response.

IP5 (Long Form) is, for each frequency range and damping coefficient, a tabulation of frequency, maximum positive pseudo-velocity, minimum negative pseudo-velocity, and, if no damping is present, the residual response. See the sample problems for examples of *IP4* and *IP5* (Short and Long Forms).

One method for utilizing the various graphical outputs is first to generate the log-log grid (shock spectrum) from *IP3*, then select from the shock spectrum the important frequencies. Next, these frequencies are used as input in running the program a second time for *IP1* and/or *IP2* to produce response versus time plots for each desired frequency.

OPERATING INSTRUCTIONS

The subroutines required are from the IBM 7090 plotting package written by North American Aviation for the Stromberg-Carlson 4020 (charactron plotter-printer). If the S-C 4020 is not available to the user, the alternate deck is used, in which no S-C 4020 subroutines are called, and there are only two output options, *IP4* and *IP5* (see Appendix C).

No input tapes, except for unit 5, are required; the program is run under *IBSYS* version 13. Three output tapes are needed for the program, one tape for the S-C 4020, if used; logical tape unit 6; and logical tape unit 8. *IP4* is written on unit 8, and *IP5* is written on unit 6.

An approximation of the running time of the program, using the input setup from Sample Problem 1 (see Figure 2), is about 7 minutes, including compiling time. The running time for the program is increased considerably if more than just a few frequencies are used with *IP1* and *IP2*.

Most of the memory is used (32K); see the dimension statement of the program-listing for the array sizes which influence the amount of memory needed.

ACKNOWLEDGMENT

The author wishes to thank George J. O'Hara for his expert guidance and advice on the engineering analysis and the organization of the program.

APPENDIX A

SAMPLE PROBLEM 1

Arrangement of Input Data

and

All the Various Forms of Output That Can Be

Generated Except *IP1* and *IP2*

SAMPLE PROBLEM 1

The input shock function is a foundation acceleration, $\ddot{Z} = 100 [e^{-12.9t} \sin 200 \pi t + e^{-208t} \sin 600 \pi t]$, which is generated in the program for each desired point. The following cards are inserted at the beginning of the program to generate the \ddot{Z} 's.

102 Z(I)=100 *EXP(-129.*T(I))*SIN(TIZ)+EXP(-208.*T(I))*SIN(3.*TIZ))

TIZ=2 *PI *100 *T(I)

DO 102 I=1,N

See Figure 2 for the arrangement of the input data.

Figure 2 – Arrangement of Input Data for Sample Problem 1

NOTE: NAMELIST SZAZA1 is omitted because the Z_i's are generated within the program.

PROGRAM RAN TO COMPLETION

APPENDIX B

SAMPLE PROBLEM 2

Arrangement of Input Data

and

All the Various Forms of Output

That Can Be Generated

SAMPLE PROBLEM 2

The following example has a set of values for the foundation velocity \dot{Z} as the input shock function; and the two following statements are inserted in the program to calibrate the \dot{Z} 's.

$$75 Z(l) = (Z(l) + 50)^* \cdot 013959$$

DO 75 I = 1, N

The data \dot{Z} for this problem was furnished by George O'Hara of the Naval Research Laboratory.

Figure 7 – Arrangement of Input Data for Sample Problem 2

NOTE: All the data cards for the first NAMELIST are not shown.

13. ABSTRACT

This paper describes a computer program and a mathematical model (developed by G.J. O'Hara of the Naval Research Laboratory) for computing shock and residual shock spectra of linear elastic structures responding to transient forces and foundation motions. A wide range of output options, from tabulated results to a four-coordinate log-log grid, is possible. Included in the mathematical analysis of the shock spectra is a refinement in determining maximum responses, suggested by O'Hara, resulting in a more accurate shock spectrum. The program is written in FORTRAN IV for the IBM 7090 and includes plotting subroutines for the General Dynamics S-C 4020 printer-plotter. The program is also coded without the S-C 4020 subroutines.

INSTRUCTIONS						
1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.	imposed by security classification, using standard statements such as:					
2a. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.	(1) "Qualified requesters may obtain copies of this report from DDC."					
2b. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.	(2) "Foreign announcement and dissemination of this report by DDC is not authorized."					
3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.	(3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."					
4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.	(4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."					
5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.	(5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."					
6. REPORT DATE: Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.	If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.					
7a. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.	11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.					
7b. NUMBER OF REFERENCES: Enter the total number of references cited in the report.	12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.					
8a. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.	13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.					
8b, 8c, & 8d. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.	It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).					
9a. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.	There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.					
9b. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).	14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, roles, and weights is optional.					
10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those
